

PORCELQUICK STAINLESS STEEL TILE TRIM MAINTENANCE

PorcelQuick stainless steel trims are made of 316L stainless alloy which offers superior corrosion resistance and is typically used in marine environments and heavy industrial atmospheres, however all stainless steels require some maintenance.

Cleaning is necessary to preserve corrosion resistance. Stainless steel has chromium added to the alloy which naturally forms a thin layer of chromium dioxide to protect against corrosion. Contamination of this surface reduces its effectiveness, so it is important to routinely carry out simple cleaning of the trims.

The cleaning regime is very simple: wipe down with a wet warm cloth or sponge once or twice a month.

If the trim is scratched or showing minor rust stains, use a mild abrasive cleaner such as Cif and follow up by wiping with a damp warm cloth or sponge.

If the metal is contaminated with oil or grease clean with acetone (nail polish remover) and follow up with a warm water wipe.

PORCELQUICK STAINLESS STEEL TILE TRIMS ROUND SWIMMING POOLS

PorcelQuick stainless steel trims are made of 316L stainless alloy. Stainless steels are widely used for pool ladders, hand rails and diving board structures and perform well in a swimming pool environment, however all stainless steels require some maintenance.

All stainless steel items around the pool should be washed down daily with a weekly wiping with a warm wet cloth. If the trim is scratched or showing minor rust stains, use a mild abrasive cleaner such as Cif and follow up by wiping with a damp warm cloth or sponge.

If the metal is contaminated with oil or grease clean with acetone (nail polish remover) and follow up with a warm water wipe.

Carbon steel brushes or carbon steel wire wool should never be used on stainless steel.
